        * @typedef {Object<string, any>} Data
        * @property {boolean} success - Whether the login was successful
        * @property {string} token - The data returned from the login
i.e. Fire Token
        */

        // data.token is the message sent from the fireOAuthChannel
after verification
        // data.success is a boolean that indicates whether the
verification was successful
        // data.token is the fire token

        // What to do with the Fire Token?
        // * Fire Token is an unique token which uniquely identifies the
user who authorized your login attempt with Fire
        // * You can use this token ONLY ONCE as it will be destroyed
after the first use

        // 1. Send the fire token to the Fire Server to verify the user
        // - You can do that client sided or server sided
        // - You need to send a POST Request to the Fire Server with
the fire token
        // at the URL: http://localhost:3003/api/tokens/verify

```

```

        // - The Fire Server will verify the fire token and return a
response
        // - If the verification was successful - CODE (200), the
Fire Server will return a response with the user's data
        // - If the verification was unsuccessful - CODE (400) or
CODE (401), the Fire Server will return a response with an error 'message'
        // - You can use the data returned from the Fire Server to
create a new user in your database

        // This example will send the token to Fire Servers and
console.log the response
        console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f;
font-weight: bold;`);
